Features

- Each universal transmitter has four inputs that can be wired in from the external product.
- The universal transmitter will monitor these inputs (alarm outputs from the external product) and will send an intruder or tamper signal depending on its configuration.
- The Universal transmitter can also be configured to emulate the Roboguard hand held remote transmitters.
- The Universal transmitter can be configured as a repeater station with the addition of a Universal Receiver. In this configuration the transmitter will transmit any received Roboguard signal with a user configured delay.
- This is most useful for sites where radio signal transmission is problematic.
